The designations employed and the presentation of material in this information product do not imply the expression of any opinion whatsoever on the part of the Food and Agriculture Organization of the United Nations concerning the legal status of any country, territory, city, or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

The document should be cited as follows:

Oduor A.R. Gadain, H. M. 2007: Potential of Rainwater Harvesting in Somalia, A Planning, Design, Implementation and Monitoring Framework, Technical Report NoW-09, 2007,FAO-SWALIM, Nairobi, Kenya.

Preamble

In 2004, the Food and Agriculture Organization of the United Nations (FAO) established a project entitled Somalia Water and Land Information Management Systems, SWALIM. SWALIM's objective is to contribute to improved water and food security in Somalia by:

- collecting data needed for water and land resources management
- generating user-friendly information from the data
- storing the information in easily accessible databases and disseminating it through conventional and electronic media
- building capacity among Somali authorities to take over these functions in the future.

In March 2007, FAO-SWALIM signed a memorandum of understanding with ICRAF with the aim of producing a number of outputs. These include rainwater harvesting (RWH) classification scheme and definition system; identifying traditional water conservation systems; identifying technical and socio-economic factors for evaluating, planning and designing RWH projects; assessing the potential of RWH practices for increased agricultural or livestock production; and creating links between national institutions and international bodies or networks involved in RWH. The final output is a common framework for planning, designing, implementing and monitoring RWH projects.

To achieve these objectives and outputs, two rounds of trips were organized for fact-finding missions and consultative workshops in April and May 2007. These events took place in Puntland, Somaliland and Southern Somalia, drawing participants from relevant line ministries in government, UN agencies, international non-governmental organizations and community-based organizations. The draft framework was presented in Nairobi for ratification in June 2007. It is envisaged that the final products that include the framework document and assessment report on the potentials of RWH technologies shall act as reference material for policy makers to prioritize and guide community, government and external support agencies, on RWH investment options.

Table of Contents

Disclaimer	i
Preamble	ii
Table of Contents	iii
List of Plates	vi
List of Annexes	vii
List of Tables	viii
List of Tables	viii
Acronyms	ix
Local terms.....	x
Acknowledgement	xi
1. Introduction.....	1
1.1 Background and general context.....	1
1.2 Problem statement.....	2
1.3 Objectives of the assessment	2
1.4 Methodology	3
1.5 Challenges, opportunities and benefits of RWH in Somalia	4
1.6 Expected outcome	6
2. Climatic and Hydro-physical Factors Influencing Rainwater Harvesting in Somalia.....	7
2.1 Rainfall.....	7
2.2 Potential evaporatranspiration	9
2.3 Air temperature and wind speed	9
2.4 Landforms and vegetation cover.....	10
2.5 Soil types.....	10
3. Historical Development and Technological Options of RWH in Somalia.....	11
3.1 Water resources in various regions of Somalia.....	11
3.2 Indigenous technologies	11
3.3 Current RWH technologies in Somalia.....	12
3.4 Technological options for RWH and conservation systems in Somalia.....	13
3.4.1 Ex situ agricultural RWH systems	13
3.4.2. In situ water conservation	14
3.4.3 Rainwater management for agro-forestry systems	16
3.4.4 Rainwater for livestock production.....	18
3.4.4 Domestic water harvesting systems in Somalia.....	18
3.4.6 Water conservation in sandy river beds	19
4. Design of RWH Systems.....	21
4.1 Introduction.....	21
4.2 Design considerations for agricultural systems - ponds	21
4.2.1 The catchment area	22
4.2.2 Conveyance mechanisms	23

4.3 Design considerations for berkads	30
4.3.1 The catchment area	31
4.3.2 Conveyance mechanism.....	31
4.3.3 Design considerations for storage.....	32
4.3.4 Abstraction of water for animal or domestic use	33
4.4 Design of roof water harvesting systems: the case of berkad guris	36
4.4.1 Design considerations and aspects for roof catchments	37
4.4.2 Conveyance, by pass and filtering mechanisms	37
4.4.3 Storage and abstraction.....	39
4.4.4 Demand-based approach to sizing a berkad guri	40
4.4.5 Total annual available rainwater from roof catchments	40
4.4.7 Sizing roof rainwater tanks using nomographs.....	42
5. Quality Aspects of Stored Rainwater	44
5.1 Introduction.....	44
5.2 Domestic water treatment techniques	44
5.2.1 Leaf screening.....	44
5.2.2 Manual foul flush mechanisms	45
5.3 Agricultural water quality management.....	50
5.4 Livestock water quality requirement	50
6. Assessment of RWH Potential for Somalia	53
6.1 Introduction.....	53
6.2 Assesment of RWH potential for Somalia	53
7. Institutional and Policy Aspects in RWH Projects	56
7.1. Overview of current status.....	56
7.2 Excerpts from existing water policies.....	56
7.3 Role of local and external support agencies	57
8. Planning, Implementation and Monitoring of RWH Interventions.....	59
8.1 RWH projects implementation	60
8.2 RWH projects monitoring and evaluation	61
9. Conclusions and recommendations.....	63
References.....	64
Annexes.....	66

List of Figures

Figure 1: Change in construction quality over time.....	5
Figure 2: Area per region.....	8
Figure 3: Rainwater potential per region prior to partitioning.....	8
Figure 4: Rainwater potential per unit area.....	8
Figure 5: Wind speed at some stations	10

Figure 17: Optimizing tank size using mass curve analysis method	42
Figure 18: An example of a nomograph for estimating required tank size	43
Figure 21: Sand and gravel- based water filters.....	49

List of Plates

Plate 1: Participants during consultative workshops in Garowe, Hargeisa and Baidoa	3
Plate 2: A typical Berkad guri depicting the catchment, conveyance and storage components	19
Plate 3: A typical ephemeral stream with a sandy riverbed in Somalia.....	20
Plate 4: A balley filled with water during the rainy season	22
Plate 5: Runoff conveyance channel during construction.....	23
Plate 6: Runoff conveyance channel in north-west Somalia after having developed into a gully and conveying a lot of silt to the pond.....	24
Plate 7: A section of a balley embankment destroyed by 2007 Gu rains	28
Plate 8: A typical berkad in Somalia.....	30
Plate 9: Siltation of a berkad	31
Plate 10: Mitigating evaporation losses from berkads using grass covers.....	33
Plate 12: A Berkad guri showing the roof runoff harvesting components	36
Plate 13: Current practice of drawing water from the berkad guris.....	40
Plate 14: A guide for harvestable domestic roof water.....	41

List of Annexes

Annex 14: Factors to consider in the planning, design, and implementation of agricultural RWH systems.....	80
Annex 15: Factors to consider in the planning, design, and implementation of domestic RWH systems.....	81
Annex 16 Analysis for Borama 20mm Rainfall threshold.....	82
Annex 19: Runoff water harvesting potential for agriculture and rangelands.....	85
Annex 22: Rainwater Harvesting Potential for Garoowe	88
Annex 23: Rainwater Harvesting Potential for Garowe	89
Annex 24: Rainwater Harvesting Potential for Hargeisa.....	90
Annex 25: Rainwater Harvesting Potential for Borama	91
Annex 26: Rainwater Harvesting Potential for Borama	92
Annex 27: Rainwater Harvesting Potential for Bossaso.....	93
Annex 28: Rainwater Harvesting Potential for Bossaso.....	94
Annex 29: Rainwater Harvesting Potential for Jowhar	95
Annex 31: Streams feeding into for Somalia.....	97

Local terms

<i>balli</i>	A natural depression on flatter silt soils that collect surface runoff with water-holding capacity ranging from less than 1000 m ³ to more than 100,000 m ³ .
<i>war</i>	A stock pond excavated either by hand, and within the last 15 years by machinery, in heavy sealing soils whose capacity for holding water ranges from less than 100 m ³ to more than 10,000 m ³ .
<i>berkad</i>	A concrete-lined reservoir roofed either with corrugated iron sheets or shaded with small bushes suspended over the tanks with nets. Its capacity ranges from 30 to 400 m ³ .
<i>xurfad</i>	Either a water pond or earth dam.
<i>ceel</i>	A hand-dug well.
<i>berkad guri</i>	Roof water harvesting.
<i>majaroor</i>	Roof water harvesting.
<i>naxaroor</i>	Soil bunds constructed to conserve both soil and water.
<i>xadhig</i>	Soil bunds constructed to conserve both soil and water.
<i>il</i>	Natural spring
<i>doox xidh</i>	A sub-surface dam constructed in sandy rivers
<i>deshek</i>	Flood-diversion techniques used for delivering flood water for irrigation purposes
<i>mugsid</i>	An underground reservoir
